Note: This article is designed to cover version 2.5 of AutoCAD and is also applicable to the older, now defunct version 1.0. (Read: Automation) 1. Viewing Main Parts of AutoCAD Screen The initial view in AutoCAD shows the AutoCAD window. This is the work area of the program, as well as the workspace for the drawing. AutoCAD uses the sheet in the upper right corner of the screen to change between the different views. To access the AutoCAD window, first select View, and then Main. Figure 1. Main AutoCAD Window The default View is Workplane, which shows the currently displayed work area as a two-dimensional view. Figure 2. View Options The Main view is designed to display most of the features of the AutoCAD program. In the Print Layout section, you will find several options for modifying the printing layout of a drawing. You can also display details on the geometry of the drawing using the Geometry or Properties section. The Properties panel is a collapsible panel on the right side of the drawing that displays the properties of objects in the drawing. In the Current Drawings section, you can see the list of all the drawings currently open in the program. You can access the status of the current drawing by clicking on the label that displays the drawing name. You can also see a list of project files that are open in the program. The status of the current document can be accessed from the Status bar, which is visible at the top of the screen. The status bar provides a way to show the status of the last few documents that were opened in the program. You can also see the time and date of the last document that was opened. The status bar also provides additional buttons and tabs that are more detailed about the current drawing. You can open and close drawings from the list. Figure 3. Status Bar There are several options for choosing which parts of the screen to display, as well as a few options for hiding or showing features on the screen. From the View menu, you can choose to hide the menus, toolbars, or either the normal view or the display surface. You can also hide the status bar and hide the panels from the drawing. The View menu also has options for switching between the various views that AutoCAD supports. Using the View menu also lets you turn the

Launch the Keygen. Select Product name, License key or any required option. Enter the product key and press Ok. Enjoy! 1. Field of the Invention The present invention relates to a reproducing apparatus and a reproducing method for a data stream, which are suitably applied to a reproduction apparatus and a reproduction method for a stream of data, such as a moving picture, which is coded on a block-by-block basis. 2. Description of the Related Art An MPEG-2 (Moving Picture Experts Group) stream of data, which is a compression data stream of moving picture data, will be explained as an example of a data stream, such as a moving picture, which is coded on a block-by-block basis. A GOP (group of pictures) structure of the MPEG-2 stream of data is as shown in FIG. 1. As is seen from the figure, one GOP is constituted of an I (intra-frame) picture (one I picture is contained in one GOP), a P (predictive-frame) picture (one P picture is contained in one GOP), and a B (bi-directional-frame) picture (one B picture is contained in one GOP). FIG. 2 is a block diagram showing a conventional data stream reproducing apparatus. In the figure, reference numeral 11 designates a CPU (Central Processing Unit) which executes a reproduction control of data, and 12 designates a DRAM (Dynamic Random Access Memory) in which a data reproduction buffer is stored. The buffer size of the DRAM 12 is set to a value which is smaller than a total of the sizes of the data of the GOPs stored in the buffer. A data block is obtained by dividing a data of a picture into a predetermined number of pixels in a main scan direction (in a horizontal direction) and a sub-scan direction (in a vertical direction). A data of a block is read from the DRAM 12 and supplied to a block processing circuit 13. The block processing circuit 13 performs the following three processes on the input data of the block. First, a data segmentation process is performed on the input data of the block to extract a data block from the data of the GOPs contained in the input data of the block. In the data segmentation process, an operation is performed so as to extract a data segment of 16 pixels (in the main scan direction) and 16 lines (in the sub
